## CLAIMS

1. A method of production of a metallic product with a nanocrystallized surface layer,

said method of production of a metallic product with a nanocrystallized surface layer characterized by comprising:

- (1) subjecting a surface layer of a metallic product to ultrasonic impact treatment impacting it by one or more ultrasonic indenters vibrating in a plurality of directions, then
- (2) subjecting the surface layer subjected to the ultrasonic impact treatment to heat treatment at a low temperature to cause precipitation of nanocrystals.

- 2. A method of production of a metallic product with a nanocrystallized surface layer as set forth in claim 1, characterized in that the surface layer of the metallic product subjected to said ultrasonic impact treatment is in an amorphous state.
- 3. A method of production of a metallic product with a nanocrystallized surface layer as set forth in claim 1 or 2, characterized in that said ultrasonic impact treatment is accompanied with mechanical alloying.
  - 4. A method of production of a metallic product with a nanocrystallized surface layer as set forth in any one of claims 1 to 3, characterized by making an amorphous phase and a nanocrystal phase copresent in precipitation of said nanocrystals.
  - 5. A method of production of a metallic product with a nanocrystallized surface layer as set forth in any one of claims 1 to 4, characterized by shielding the surroundings at the time of said ultrasonic impact treatment from the air.
  - 6. A method of production of a metallic product with a nanocrystallized surface layer as set forth in any one of claims 1 to 5, characterized in that the surface layer of said metallic product is comprised of a ferrous metal and said surface layer is subjected to heat

treatment for heating at 100 to 500°C for 15 minutes or more.
